

Medical Lab Analysis Report

Report Generated: December 21, 2025 at 01:12 AM

Patient: John Doe

Age: 45

Patient ID: TEST-12345

Laboratory Test Results

Test Name	Value	Unit	Status	Reference Range
Creatinine	1.8	mg/dL	HIGH	0.7 - 1.3
Egfr	45	mL/min/1.73m ²	LOW	> 90
Bun	25	mg/dL	NORMAL	7 - 20
Glucose	105	mg/dL	NORMAL	70 - 100

Chronic Kidney Disease Risk Assessment

Risk Level: MODERATE

Risk Score: **35.00%**

Your test results show moderate risk factors for chronic kidney disease. Consider lifestyle modifications and regular monitoring.

Medical Analysis & Explanation

Your lab results show some concerning values that require attention.

Your creatinine level is elevated at 1.8 mg/dL, which is above the normal range. This indicates that your kidneys may not be filtering waste as efficiently as they should. Additionally, your eGFR (estimated Glomerular Filtration Rate) is 45 mL/min/1.73m², which is below the normal threshold and suggests reduced kidney function.

These findings, combined with your risk assessment, indicate a moderate risk for chronic kidney disease. While this is not an immediate emergency, it does require attention and lifestyle modifications.

Your BUN and glucose levels are within normal ranges, which is positive. However, the kidney function markers need to be monitored closely.

Personalized Recommendations

1. Schedule an appointment with a nephrologist within 2-4 weeks for comprehensive evaluation
2. Increase water intake to 8-10 glasses per day to support kidney function
3. Reduce sodium intake to less than 2,300mg daily
4. Monitor blood pressure regularly and maintain it below 130/80 mmHg
5. Avoid NSAIDs (like ibuprofen) unless prescribed by your doctor
6. Follow a kidney-friendly diet rich in fruits and vegetables
7. Get regular exercise - aim for 30 minutes of moderate activity most days
8. Schedule follow-up lab work in 3 months to monitor kidney function
9. Limit protein intake as recommended by your healthcare provider
10. Avoid smoking and limit alcohol consumption
